Nowadays, managing event bookings manually is difficult and can lead to mistakes.

People often struggle to find events, book tickets, and keep track of their bookings.

This project helps solve these problems by creating an easy-to-use online platform.

Users can quickly register, log in, and explore available events.

They can book tickets instantly without any confusion.

All user and booking details are safely stored in a database.

The system also generates unique tickets for each booking.

Overall, this project makes event management simple, fast, and user-friendly.

PROBLEM STATEMENT

1
2
3
4
5
6
7
8
9

1. In many event management scenarios, ticket booking and user handling are done manually or through inefficient systems.
2. This leads to errors in maintaining user data, ticket records, and event details.
3. Users often face difficulty in registering, logging in, and booking tickets smoothly.
4. There is no proper system to track bookings and avoid duplication.
5. Manual processes also consume more time and reduce overall efficiency.
6. There is a need for a centralized system to manage users, events, and bookings.
7. The system should provide quick access, secure data storage, and easy ticket generation.
8. Hence, an automated event ticketing system is required to improve accuracy and user experience.

OBJECTIVE(S)

1
2
3
4
5

9

To Design and Develop

- To create a **simple and user-friendly website** where users can view event details and book tickets within **3 minutes**.
- To design a **centralized database** to store event details, user information, and booking records.

To Implement

- To implement a **secure login system** so that only registered users can book tickets.
- To implement **QR code generation** that provides a unique ticket after successful payment.

To Improve

- To improve **booking speed** so the system can handle **500+ users at the same time**.
- To make the website **responsive**, so it works smoothly on both **mobile and desktop**.

PROPOSED SYSTEM

1

5
6
7
8
9

The system provides an online platform for users to register, log in, and book event tickets easily.

It eliminates manual work by automating user management and ticket booking processes.

All data such as users, events, and bookings are stored securely in an SQL database.

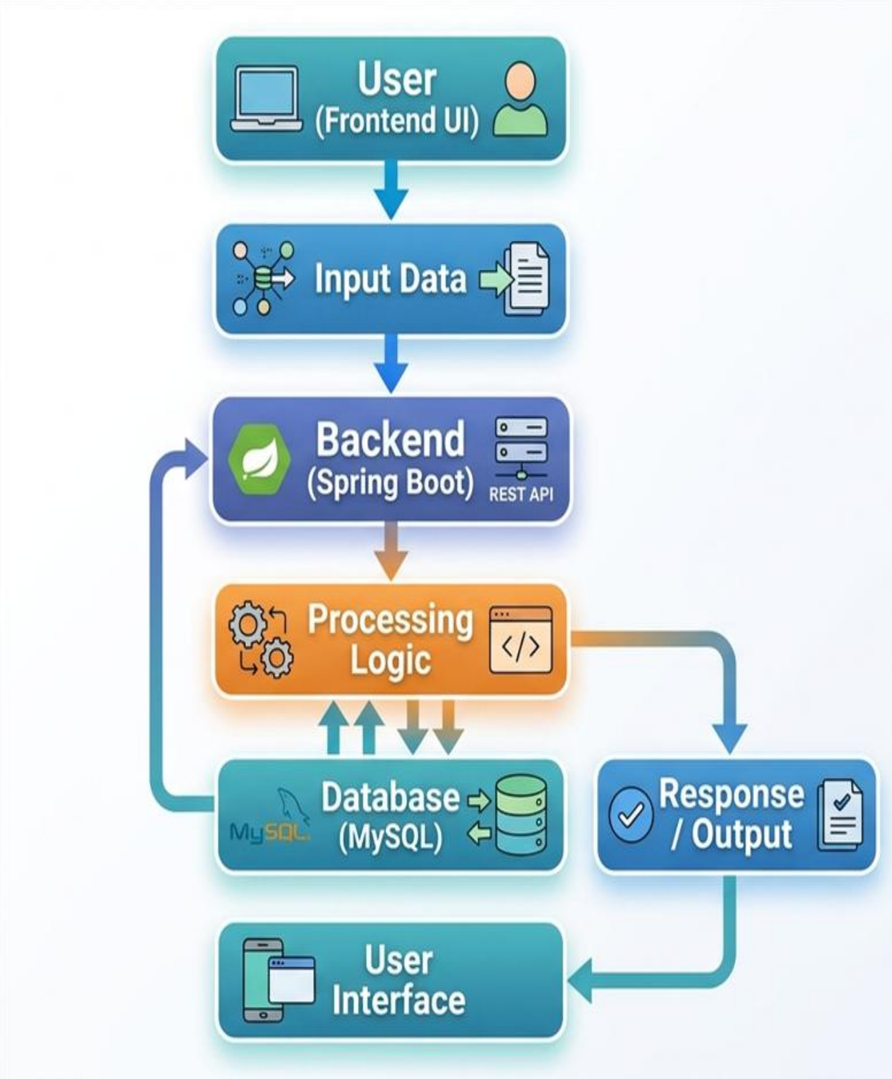
The system generates unique ticket numbers for each booking to avoid duplication.

It improves accuracy by reducing human errors in data handling.

Users can quickly view available events and book tickets in real-time.

Compared to existing systems, it is faster, more reliable, and user-friendly.

PROPOSED SYSTEM ARCHITECTURE



Explanation:

Input:
User enters data such as registration details, login credentials, event selection, and booking information through the frontend.

Processing:
The backend (Spring Boot) handles business logic like validation, authentication, ticket generation, and booking processing.

Database:
All data including users, events, and tickets are stored and managed in a MySQL database securely.

Output:
The system returns results such as registration confirmation, login status, event details, and ticket booking confirmation to the user.

TECHNOLOGIES USED

1
2
3
4
5
6
7
8
9

Frontend:
HTML, CSS, JavaScript

Backend:
Spring Boot (Java)

Database:
MySQL

Tools:
Eclipse IDE / Visual Studio Code, Postman, MySQL Workbench

Hardware/Software Requirements:
Minimum 4GB RAM, 64-bit OS (Windows/Linux), JDK 17+, Maven, Web Browser (Chrome/Edge), Internet connection for API testing

MODULE DESCRIPTION

Module 1: User Management

Handles user registration, login, and authentication. Stores user details securely and manages user sessions.

Module 2: Event Management

Manages event creation, event listing, and details like location, price, and availability.

Module 3: Ticket Booking

Allows users to book tickets, generates unique ticket numbers, and prevents duplicate bookings.

Module 4: Database Management

Stores and manages user, event, and ticket data efficiently using SQL, ensuring data integrity and quick retrieval.

ADVANTAGES & LIMITATIONS

Advantages:

1. Reduces manual work by automating ticket booking and user management.
2. Provides fast and easy access to events and booking services.
3. Ensures data accuracy and minimizes human errors.
4. Stores data securely in a centralized database.
5. Generates unique tickets, avoiding duplication issues.
6. User-friendly interface improves overall user experience.

Limitations:

1. Requires internet connection to access the system.
2. Basic security (no advanced authentication like OTP or encryption).
3. Limited scalability for very large number of users/events.
4. No online payment integration in current version.
5. Depends on system/server availability (downtime affects usage).

Thank you
